

Preliminarna analiza LLM napovedi

Marjan Meglen

4. Maj 2026

1 Namen in podatki

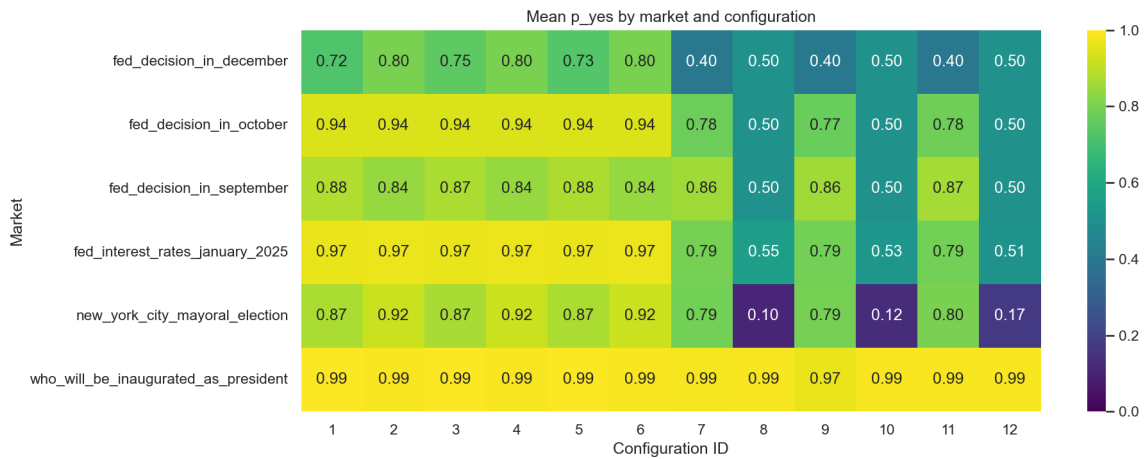

Analiza povzema preliminarne rezultate eksperimenta `llm-trader`. Osnovna spremenljivka je p_{yes} , tj. verjetnost, ki jo je model pripisal razrešitvi trga v **YES**.

Podatki vsebujejo 6 trgov, 12 konfiguracij in 20 dnevnih napovedi na trg in konfiguracijo. Skupaj je analiziranih 1440 napovedi. Primerjave s parnimi t-testi so izvedene ločeno po trgih, pri čemer je par definiran z istim datumom in dvema primerjanimi konfiguracijama.

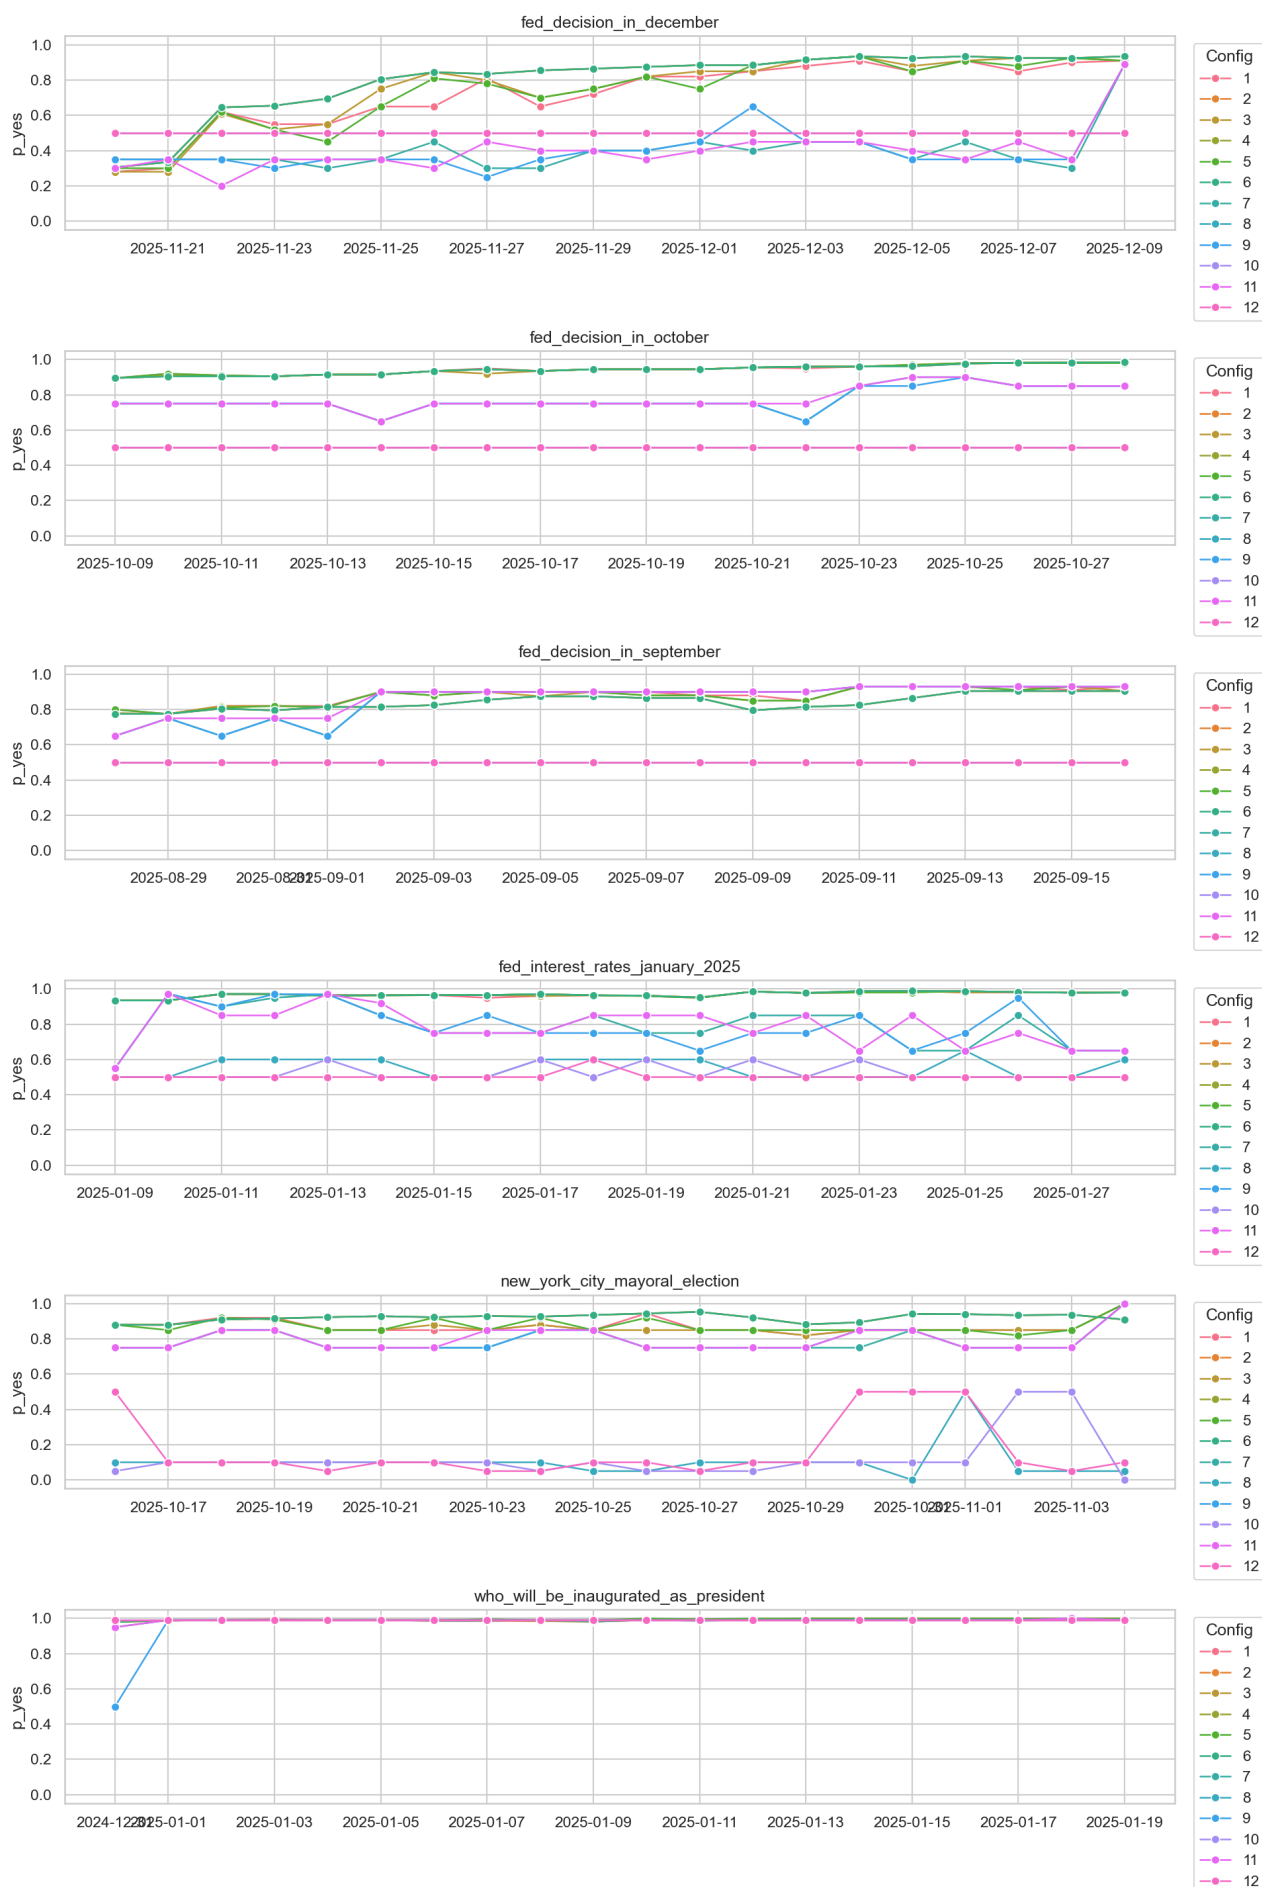

Tabela 1: Preslikava konfiguracij.

3 Parni t-testi

Pozitivna razlika pomeni, da je bila vrednost p_{yes} višja v konfiguraciji A kot v konfiguraciji B. V tabelah so prikazani povprečna razlika, 95% interval zaupanja, statistika t in vrednost p .

3.1 Učinek novic

Tabela 4: Parni t-testi za učinek novic po trgih.

4 Kratek povzetek

- Prikaz tržnih verjetnosti ima najbolj izrazit in najbolj konsistenten vpliv na napovedi p_{yes} .
- Učinek novic je odvisen od trga in konfiguracije; smer učinka ni enotna čez vse trge.
- Informacija o drugih udeležencih trga ima manj enoten učinek kot prikaz tržnih verjetnosti.
- Pri primerjavah `llms`, `humans` in `none` so razlike večinoma tržno in konfiguracijsko specifične.
